

## About Me

Incoming SDE Intern + SDE (FTE) @ **Delhivery**  
SDE Intern + SDE (FTE) offer @ **Chaayos**  
Technical Content Writer/Engineer @ **Scaler**  
Technical Content Writer/Engineer @ **PrepBytes**  
Ex – Technical Content Writer @ **InterviewBit**  
Ex – Technical Content Engineer @ **Pepcoding**  
Offers from other Ed-tech institutions like Unstop  
(Dare2Compete), TuteDude, etc.

# Syllabus

① Getting Started

② Arrays & Strings

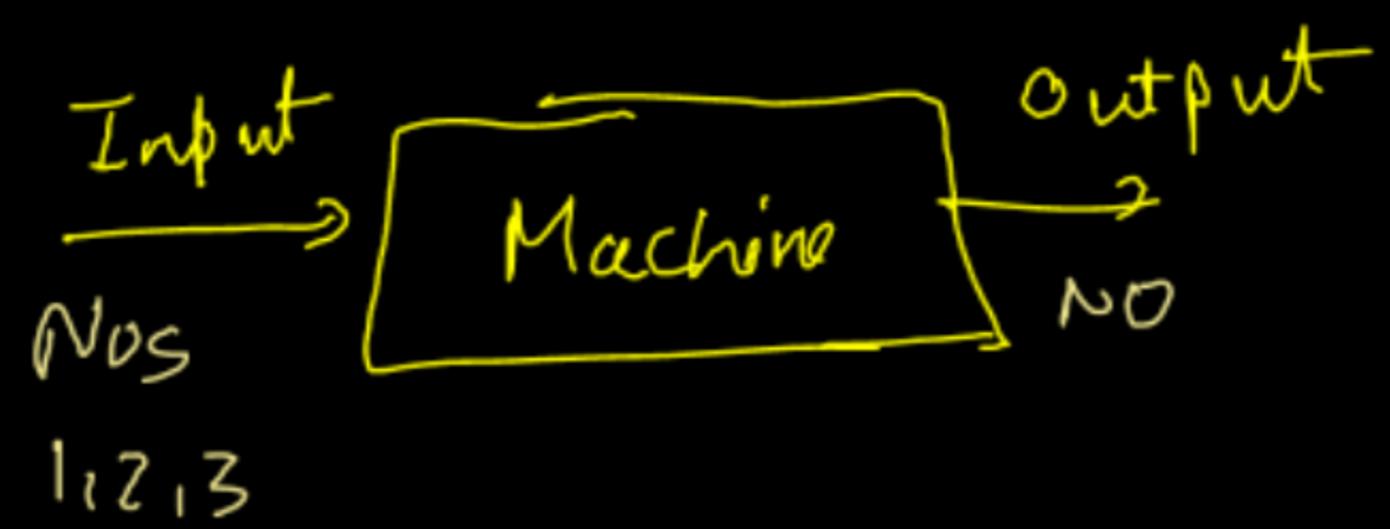

- Two Pointer + Sliding Window
- Greedy Algorithms
- \* Searching & Sorting

## (Data Structures & Algorithms)

- \* ③ linked list
- ⑥ Stack & Queue
- \* ⑦ binary Tree & Binary Search Tree
- ⑧ Hashmap & Heap
- \* ⑨ Graphs
- \* ⑩ Dynamic Programming
- ⑪ Number Theory & Bit Manipulation
- ⑫ Trie

\* Time & Space Complexity

Computer → Human convenience  
→ Machine

## # Communication

Computer understands Binary lang (0 and 1s)

Humans understand Human Lang → instructions  
+ emotions

## Prog Lang

① Computer → Software that converts

Prog Lang to Binary Lang

## Input / output

```
1 // "static void main" must be defined in a public class.  
2 public class Main {  
3     public static void main(String[] args) {  
4  
5     }  
6 }
```

→ comments

```
1 import java.util.*;  
2 public class Main {  
3     public static void main(String[] args) {  
4         //this is a comment  
5     }  
6     //this is also a comment  
7 }
```

## Print in Java

```
1 import java.util.*;  
2 public class Main {  
3     public static void main(String[] args) {  
4         System.out.print("DSA classes");  
5     }  
6 }
```

```
1 import java.util.*;
2 public class Main {
3     public static void main(String[] args) {
4         System.out.print("Guneet Malhotra");
5         System.out.print("DSA Classes");
6     }
7 }
```

## # Data types in Java

# Type of

containers.

Almirah

Drawer

Fridge

Cloth/clothes

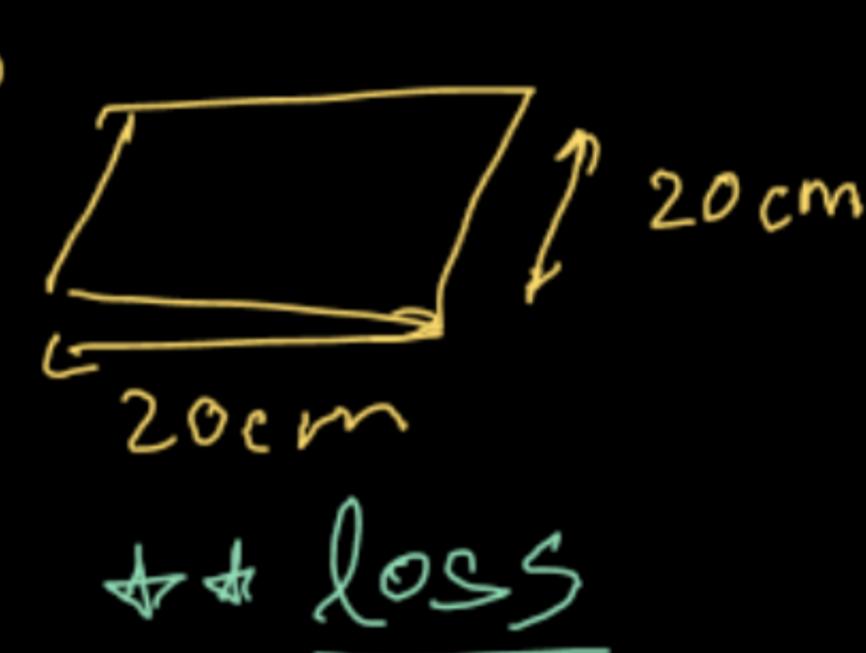

food items

Pen/Pencil

If we try to put item in

small size container, there is a loss

Scale → 30 cm

→ loss

		Size in bytes
Integral (w/o decimal)	{ byte short int long }	1      2      4      8 } 30, 50, 700 etc.
floating pt type (with decimal)	{ float double }	4 }      8 } 3.141, 8.632 etc
characters → char		2 → A-Z, a-z, 0-9, #, *, etc.
True/false → boolean		Not fixed

11/1

## # Range of Datatype

1 byte = 8 bits

$[-2^{N-1} \text{ to } 2^{N-1} - 1]$  → Here N is the no of bits.

## # Range of Short

$$\text{Size} = 2 \text{ bytes} = 2 \times 8 = 16 \text{ bits}$$

$$[-2^{16-1} \text{ to } 2^{16-1} - 1]$$

0 0 0 ... 0  
~~~~~  
(16 bits)

$$[-32768 \text{ to } 32767]$$

32768 → 17 bit

## # Data loss

```
1 import java.util.*;
2 public class Main {
3     public static void main(String[] args) {
4         int x = 100;
5         System.out.println(x);

## # Getting Started (lecture : 2)

→ Conditional statements

- ↳ if - else
- ↳ if - else if - else ladder
- ↳ switch case

} comparison  
operators  
+ logical operators

in Java

(with Memory  
concepts)

→ Loops

- ↳ for
- ↳ while
- ↳ do - while

} continue  
+ break

# Questions

- ↳ Even or odd 1
- ↳ Even or odd 2
- ↳ factorial

## # Conditional Statements

```
1 import java.util.*;
2 public class Main {
3
4     public static void main(String[] args) {
5         Scanner scn = new Scanner(System.in); → ① ✓
6         boolean b = scn.nextBoolean(); → ② ✓
7         System.out.println(b); → ③ ✓
8     }
9 }
```

# When we want the code (part of it) to execute in a certain condition.

## If - Else

```
1 import java.util.*;
2 public class Main {
3
4     public static void main(String[] args) {
5         Scanner scn = new Scanner(System.in);
6         int guessNo = scn.nextInt();
7
8         System.out.println("Start");
9         if(guessNo == 10) { → true
10            System.out.println("You have won the game");
11        } else {
12            System.out.println("You have lost the game");
13        }
14
15        System.out.println("end");
16    }
17 }
18 }
```

```
Finished in 153 ms
Start
You have won the game
end
stdin 10
```

guessNo = 10  
LHS      RHS  
comparison operator

if LHS = RHS  
→ value of this statement is true  
else it is false

$\text{if } (\text{condition}) \{$

$\equiv$        $\xrightarrow{\text{true}}$  if condition is true then this executes

$\} \text{ else } \{$

$\equiv \}$   $\rightarrow$  if condition is false, then this executes

```
1 * import java.util.*;
2 * public class Main {
3
4 *     public static void main(String[] args) {
5         Scanner scn = new Scanner(System.in);
6         int guessNo = scn.nextInt();
7
8         System.out.println("Start");
9
10        if(guessNo >= 10 && guessNo <= 20) {
11            System.out.println("You have won the game");
12        } else {
13            System.out.println("You have lost the game");
14        }
15
16        System.out.println("end");
17    }
18 }
```

Greater than or equal to

Less than or equal to

fl w

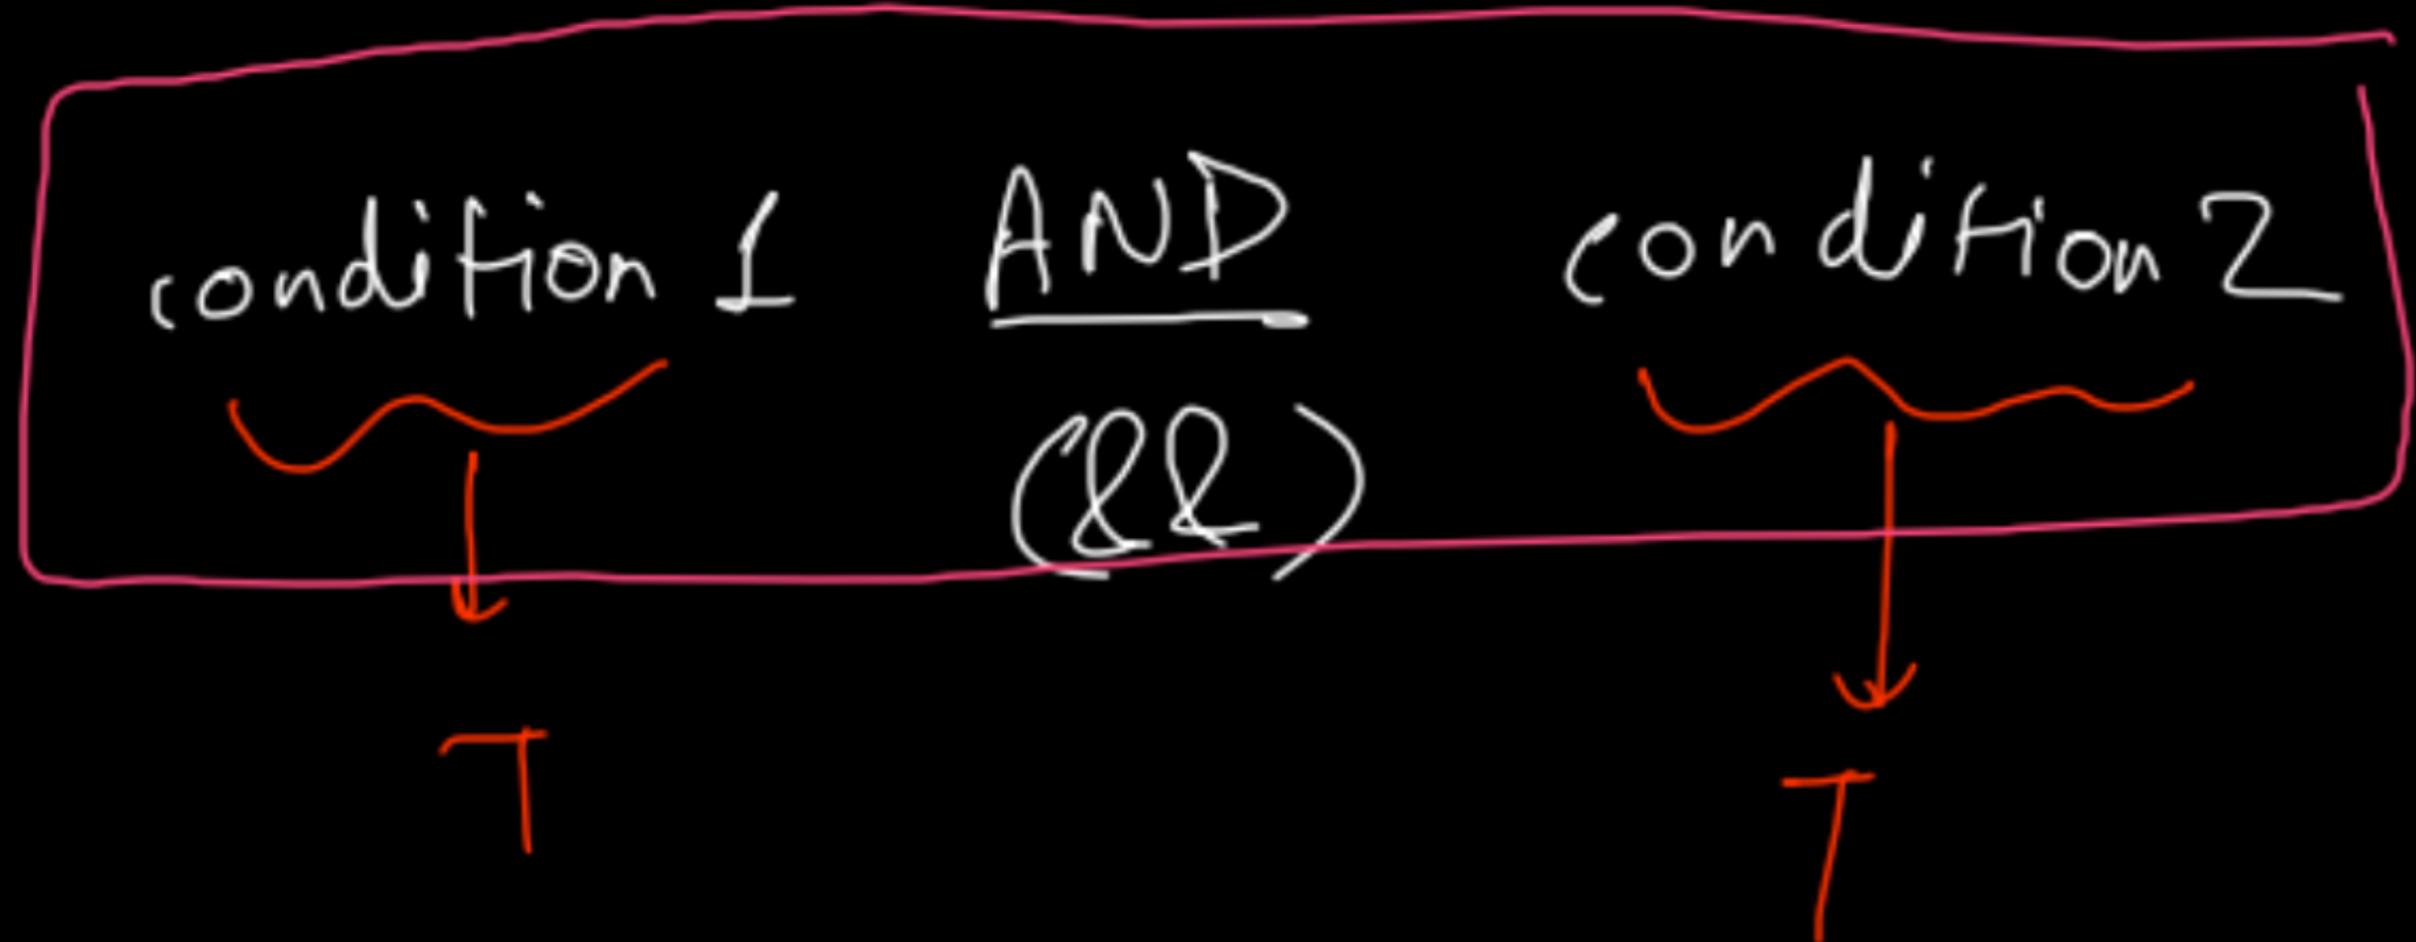

> → greater  
than

< → less than

logical AND

## AND

then AND value will be true  
else value is false

## Logical or

```
1 import java.util.*;
2 public class Main {
3
4     public static void main(String[] args) {
5         Scanner scn = new Scanner(System.in);
6         int guessNo = scn.nextInt();
7
8         System.out.println("Start");
9
10        if(guessNo == 10 || guessNo == 20) {
11            System.out.println("You have won the game");
12        } else {
13            System.out.println("You have lost the game");
14        }
15
16        System.out.println("end");
17    }
18 }
```

logical OR

cond 1    OR    cond 2

if min one is true  
answer is true

## Logical Not

```
1 import java.util.*;
2 public class Main {
3
4     public static void main(String[] args) {
5         Scanner scn = new Scanner(System.in);
6         int guessNo = scn.nextInt();
7
8         System.out.println("Start");
9
10        if(! (guessNo == 10 || guessNo == 20)) {
11            System.out.println("You have won the game");
12        } else {
13            System.out.println("You have lost the game");
14        }
15
16        System.out.println("end");
17    }
18 }
```

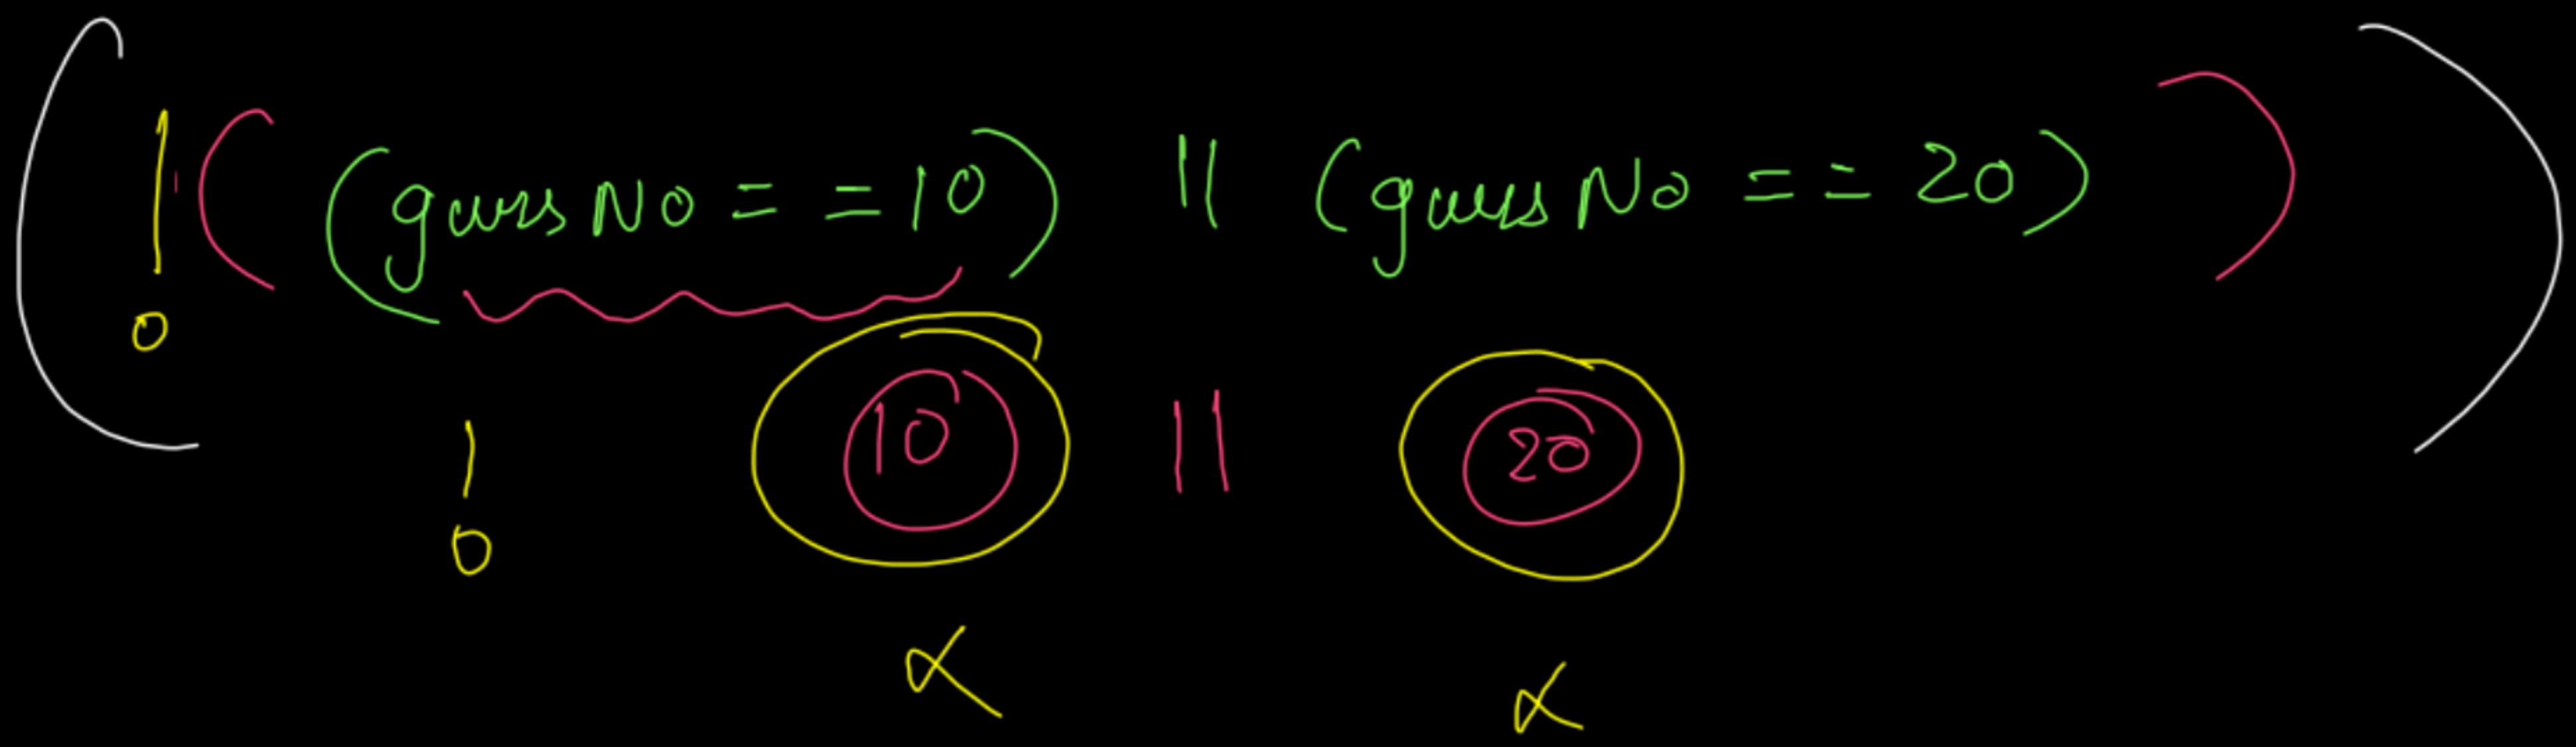

logical not

! (condition)

↳ it negates  
the condition

True → false

false → True

## Not Equal to

```

import java.util.*;
public class Main {

  public static void main(String[] args) {
    Scanner scn = new Scanner(System.in);
    int guessNo = scn.nextInt();

    System.out.println("Start");

    if(guessNo != 10) {
      System.out.println("You have won the game");
    } else {
      System.out.println("You have lost the game");
    }

    System.out.println("end");
  }
}
  
```

Not equal to

LHS is Not equal

to RHS

Then statement  
value is true

else false .

# If - elif - else ladder

```
import java.util.*;
public class Main {
    public static void main(String[] args) {
        Scanner scn = new Scanner(System.in);
        int guessNo = scn.nextInt();

## Even Odd

Easy Accuracy: 48.64% Submissions: 26932 Points: 2

We've learnt about operators and other basics of CPP. Now, it's time to take another leap and learn to use control structures that helps us choose flow of any code.

Given two integers **a** and **b**. Your task is to print the **even number first and odd number next** in individual lines.

Note: Must print end of the line at the end.

```
//User function Template for Java

class Solution{
    public void evenOdd(int a, int b){
        // Code here
        if(a % 2 == 0) {
            System.out.println(a);
            System.out.println(b);
        } else {
            System.out.println(b);
            System.out.println(a);
        }
    }
}
```

# Even No

$$N \% 2 = 0$$

# odd No

$$N \% 2 \neq 0 \in 1$$

## Odd or Even

School Accuracy: 60.31% Submissions: 13337 Points: 0

Given a positive integer N, determine whether it is odd or even.

Example 1:

Input:

N = 1

Output:

odd

Explanation:

The output is self-explanatory.

System.out.println(" ");

This is a

String

```
//User function Template for Java
class Solution{
    static String oddEven(int N){
        // code here
        if(N % 2 == 0) {
            return "even";
        } else {
            return "odd";
        }
    }
}
```

## Factorial

Basic Accuracy: 53.69% Submissions: 34040 Points: 1

Given a positive integer, N. Find the factorial of N.

Example 1:

Input:

N = 5

Output:

120

Explanation:

$5 \times 4 \times 3 \times 2 \times 1 = 120$

```
class Solution{
    static long factorial(int n){
        // code here
        if(n == 0) return 1L;
        long product = 1L; ③
        for(int i=n;i>=1;i--) {
            product = product * i; ④
        }

        return product;
    }
}
```

# factorial

$$N! = \underset{6}{N} \times (N-1) \times (N-2) \dots 1$$

$$= 1 \times 2 \times 3 \times \dots \times (N-1) \times (N-2)$$

Problem Statement

Suggest Edit

You are given a number 'N' and a query 'Q.' If 'Q' is 1, then you have to return the sum of all integers from 1 to 'N,' else if 'Q' is equal to 2 then you have to return the product of all integers from 1 to 'N.' Since the product can be very large, return it modulo  $10^9 + 7$ .

For example

Given 'N' = 4, 'Q' = 1.

Then the answer is 10 because the sum of all integers between 1 and 4 are 1, 2, 3, and 4. Hence  $1 + 2 + 3 + 4$  is equal to 10.

# Sum of 1<sup>st</sup> N natural No

$$N(N+1)/2$$

$$10^9 + 7 = (10000000007)$$

$$\begin{array}{r} \cancel{1} \\ - \cancel{0} \\ \hline \textcircled{1} \end{array} \quad \begin{array}{r} \cancel{1} \\ - \cancel{0} \\ \hline \textcircled{1} \end{array} \quad \begin{array}{c} \checkmark \\ 0 \rightarrow 10^9 + 6 \end{array}$$

$$\textcircled{1} \cdot 7 = \textcircled{1}$$

$$\textcircled{2} \cdot 7 = \textcircled{2}$$

$$\textcircled{3} \cdot 7 = \textcircled{3}$$

$$\textcircled{4} \cdot 7 = \textcircled{4}$$

$$\textcircled{5} \cdot 7 = \textcircled{5}$$

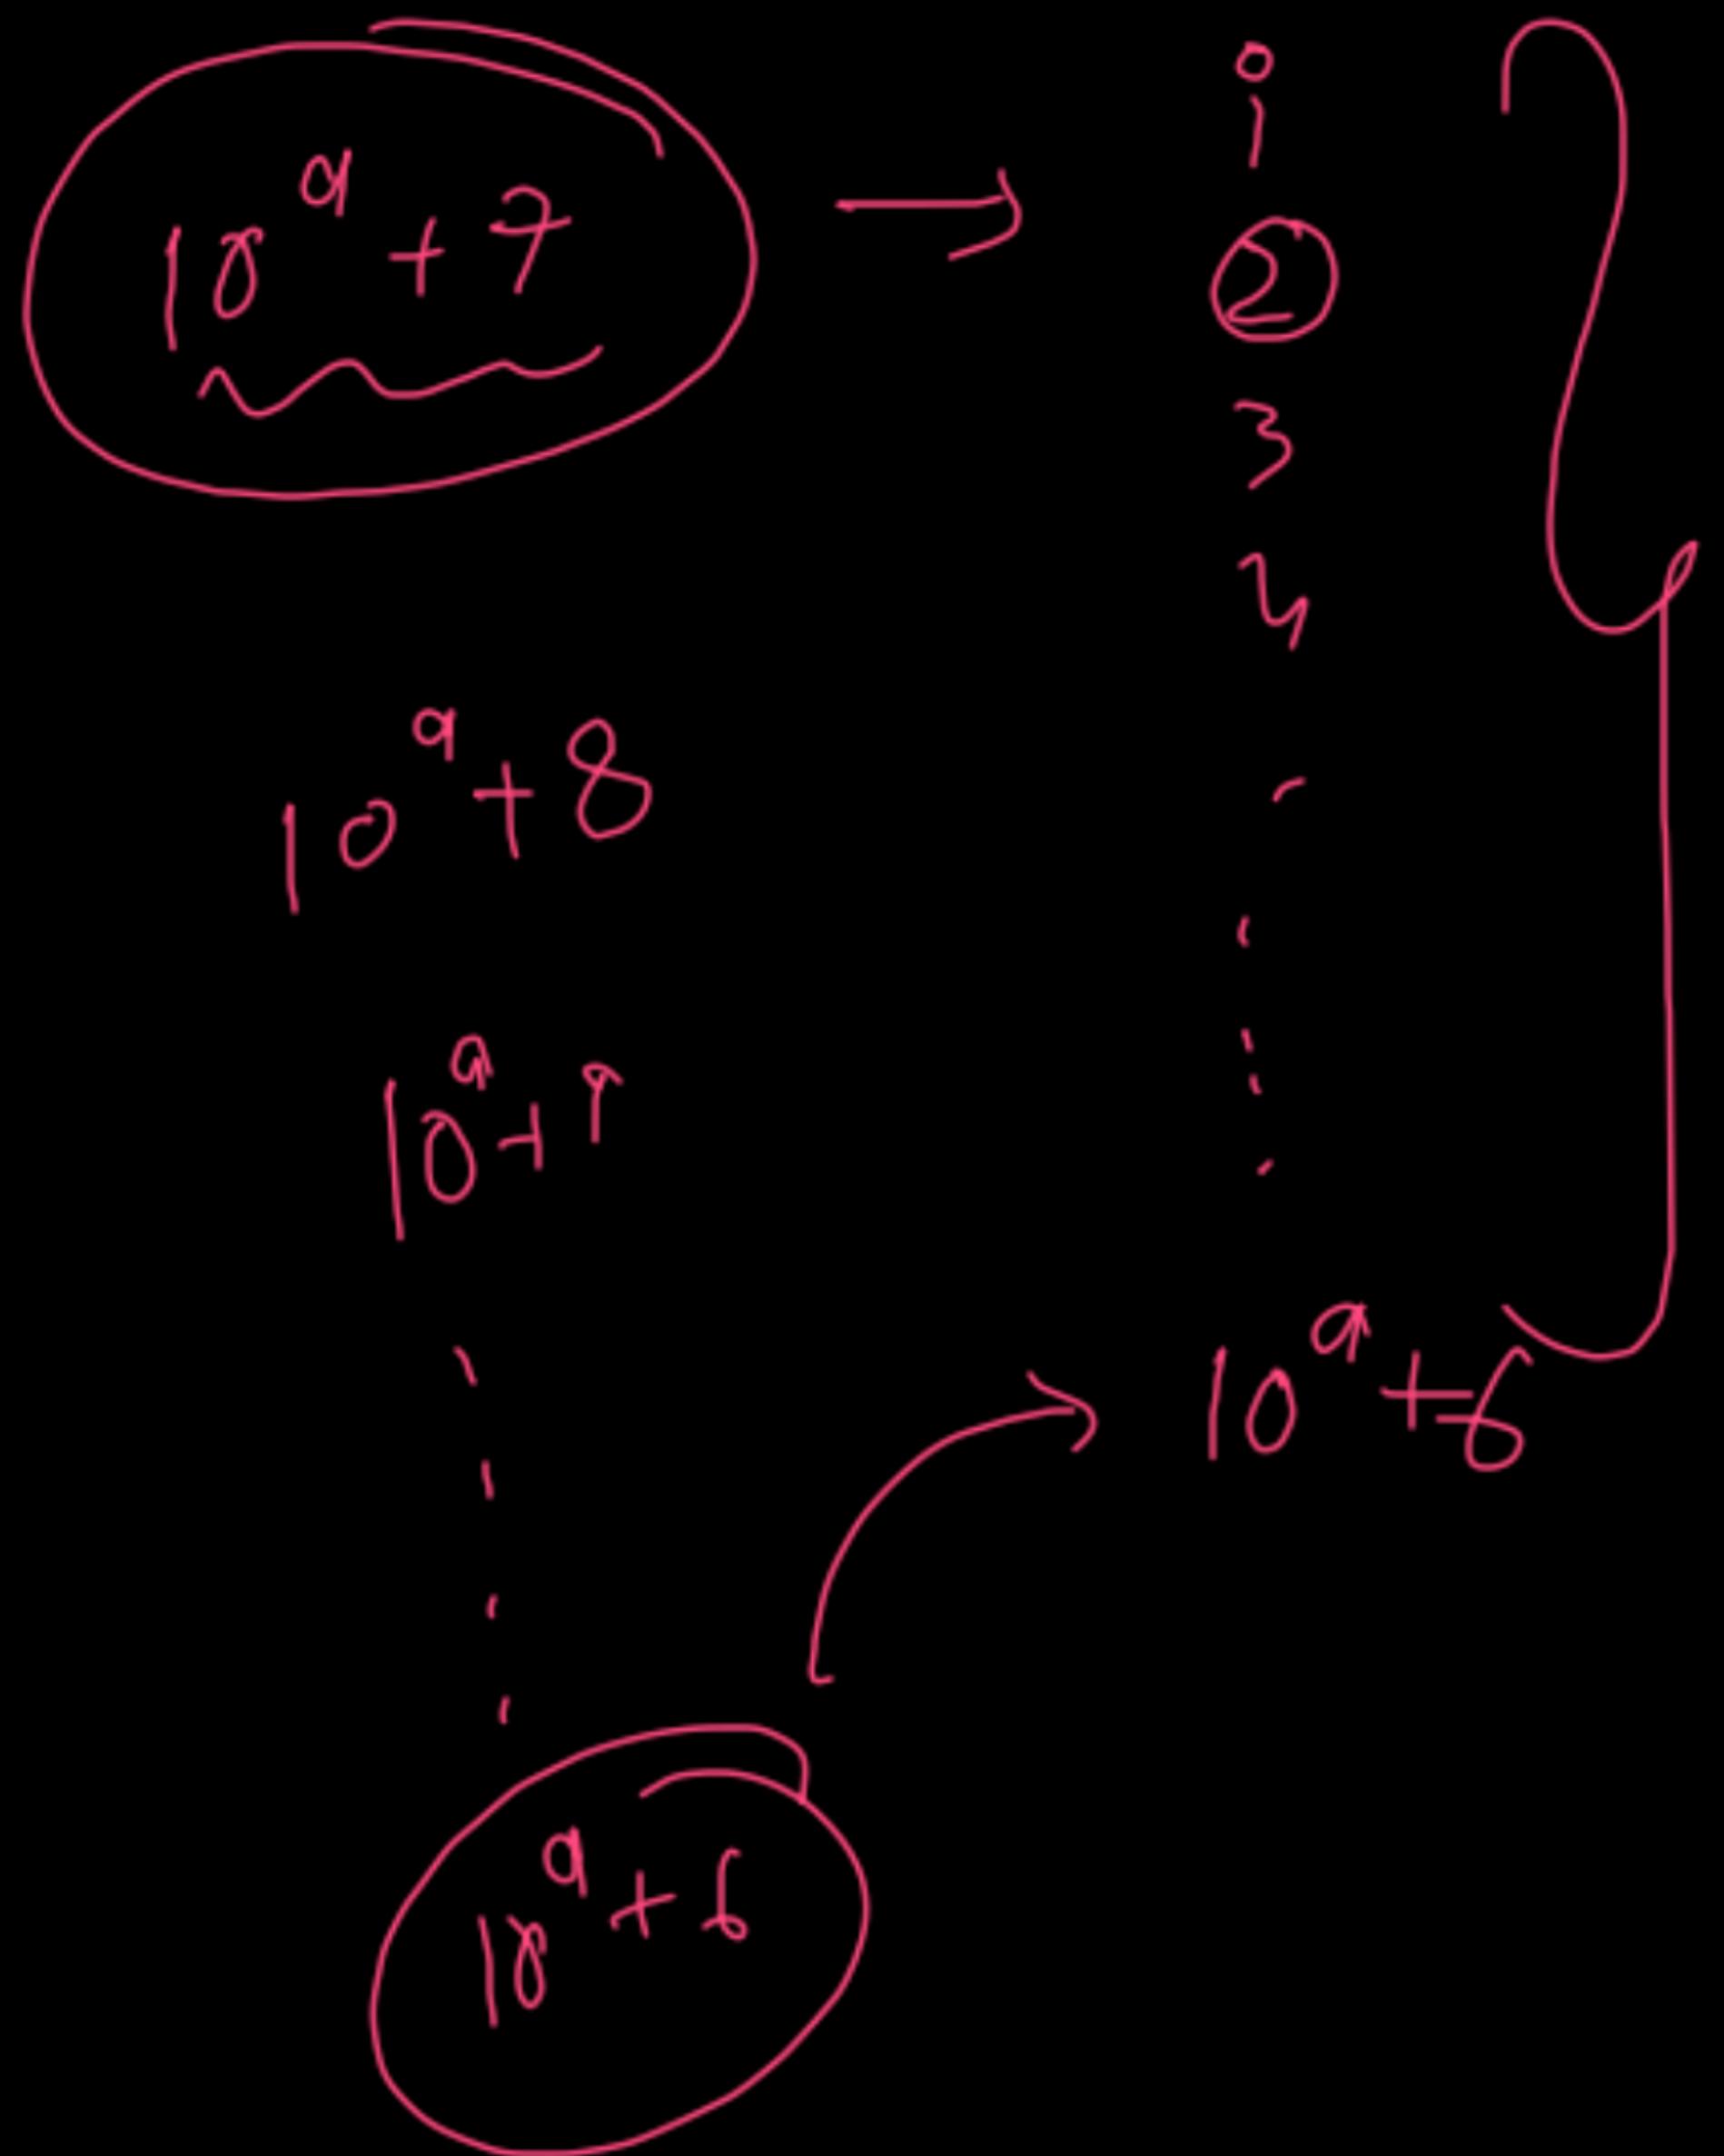

$$\textcircled{6} \cdot 7 = \textcircled{6}$$

$$7 \cdot 1 \cdot 7 = 0$$

$$8 \cdot 1 \cdot 7 = 1$$

**Problem Statement**

Suggest Edit

You have been given a number 'N'. Your task is to find the sum of all even numbers from 1 to 'N' (both inclusive).

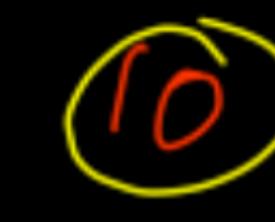

Example:

```
Given 'N' : 6
Sum of all even numbers till 'N' will be : 2 + 4 + 6 = 12
```

if (condn) 

10

1  3  5  7  9 

$$2 + 4 + 6 + 8 + 10 \rightarrow \text{ans}$$

```
public class Solution {
    public static long evenSumTillN(int n) {
        // Write your code here.
        long sum = 0;
        for(int i=1;i<=n;i++) {
            if(i % 2 == 0) sum += i;
        }
        return sum;
    }
}
```

## Swap two numbers

School Accuracy: 69.58% Submissions: 14283 Points: 0

Swap given two numbers and print them. (Try to do it without a temporary variable.) and return it.

Example 1:

Input: a = 13, b = 9

Output: 9 13

Explanation: after swapping it becomes 9 and 13.

Before Swapping

2

3

a

b

After Swapping

3

2

a

b

# Using 3<sup>rd</sup> variable

23

32

2

a

b

temp

① int temp = a;

② a = b;

③ b = temp;

## # Without 3<sup>rd</sup> Variable

$\boxed{28}$

a 3

$\boxed{52}$

b

$$\textcircled{1} \quad a = a + b \\ (2) \quad (3) = (5)$$

$$\textcircled{2} \quad b = a - b ; \\ (5) \quad (3) = (2)$$

$$\textcircled{3} \quad a = a - b ; \\ (5) - (2) = (3)$$

```

import java.util.*;
public class Main {

    public static void swap(int a, int b) {
        //swapping
        a = a + b; ✓
        b = a - b; ✓
        a = a - b; ✓
    }

    public static void main(String[] args) {
        Scanner scn = new Scanner(System.in); ①
        int a = scn.nextInt(); ②
        int b = scn.nextInt(); ③

        System.out.println("Before swapping a = " + a + " b = " + b); ④
        swap(a,b); ⑤ Pause
        System.out.println("After swapping a = " + a + " b = " + b);
    }
}

```

# Pass by Value

\* Java is always pass by value

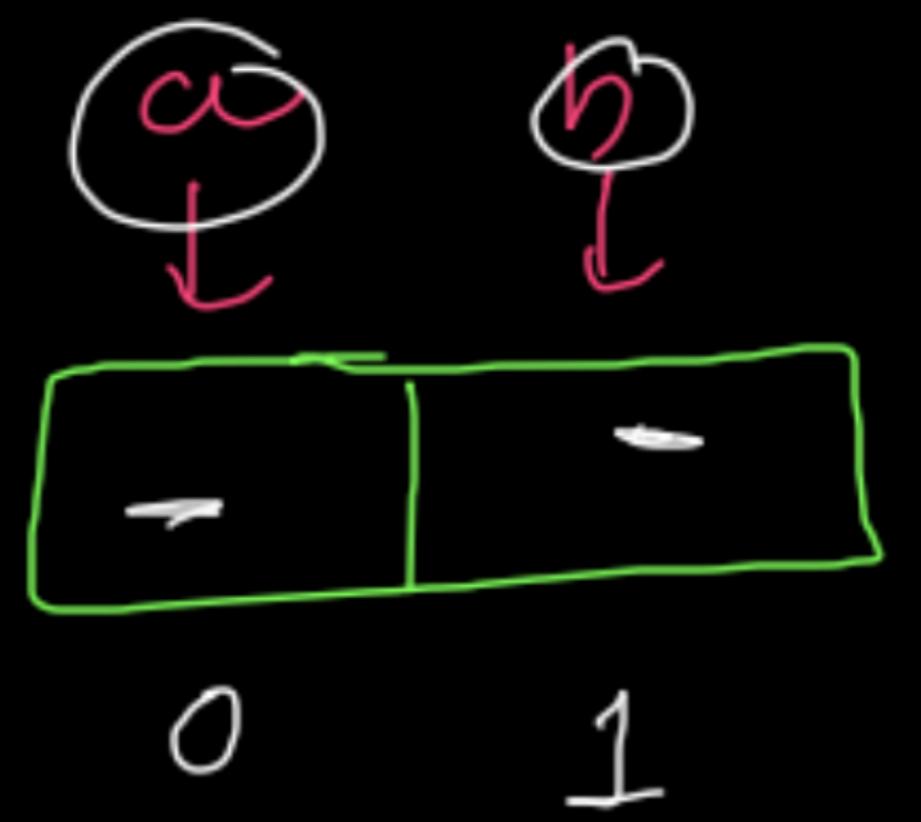

① Swap with 3<sup>rd</sup> variable

② w/o 3<sup>rd</sup> variable

③

\*\*

④ Put the nos in a data structure (Array, List, LL etc.)

→ list (changes will reflect  
across function)

```
- class Solution{
    static List<Integer> get(int a,int b)
    {
        // code here
        a = a + b;
        b = a - b;
        a = a - b;

        List<Integer> list = new ArrayList<>();

        list.add(a);
        list.add(b);

        return list;
    }
}
```

## Java Switch Case statement

School Accuracy: 66.06% Submissions: 2535 Points: 0

Given an integer choice denoting the choice of the user and a list containing the single value R or two values L and B depending on the choice.

If the user's choice is 1, calculate the area of the circle having the given radius(R).

Else if choice is 2, calculate the area of the rectangle with given length(L) and breadth(B).

```
class Solution{
    static double switchCase(int choice, List<Double> arr){
        // code here

        double r = arr.get(0);
        double l = r;
        double b = (arr.size() == 2) ? arr.get(1) : 0;

        }
    }
}
```

## # Ternary Operator

```
import java.util.*;
public class Main {

    public static void swap(int a, int b) {
        //swapping
        a = a + b;
        b = a - b;
        a = a - b;
    }

    public static void main(String[] args) {
        boolean b = true;
        int a = (b == true) ? 1 : 0;
        System.out.println(a);
    }
}
```

## Prime Number

Basic

Accuracy: 49.19%

Submissions: 56391

Points: 1

For a given number **N** check if it is prime or not. A prime number is a number which is only divisible by 1 and itself.

Example 1:

Input:

$N = 5$

Output:

1

Explanation:

5 has 2 factors 1 and 5 only.

2 → 2, 1

3 → 3, 1

4 → 2, 4, 1 ✗

5 → 5, 1

6 → 2, 3, 6, 1 ✗

7 → 2, 7

;

;

1 2 3 4 . . . . . N-1 N

↓  
loop & check

②4 1, 2 4

②9 1, 2 9

```
class Solution{
    static int isPrime(int N){
        // code here
        if(N == 1) return 0;

        for(int i=2;i<N;i++) {
            if(N % i == 0) return 0;
        }

        return 1;
    }
}
```

→ This code gives TLE.

O(N) solution

27 and 24

27 → ⑨

less than N12

24

⑫ equal to N12

$$1 \times 27 = 27$$

$$1 \times 24 = 24$$

$$3 \times 9 = 27$$

$$2 \times 12 = 24$$

$$3 \times 8 = 24$$

$$4 \times 6 = 24$$

⑪ 3, ⑨, ⑫ 27

⑪ 2, 3, 4, 6, 8, ⑫, 24

$$\textcircled{24}/\textcircled{2} = 12$$

### Find Prime numbers in a range

Medium Accuracy: 63.56% Submissions: 17866 Points: 4

Given two integers M and N, generate all primes between M and N including M and N.

```
boolean isPrime(int n) {
    if(n == 1) return false;

    for(int i=2;i*i<=n;i++) {
        if(n % i == 0) return false;
    }

    return true;
}
```

```
ArrayList<Integer> primeRange(int lo, int hi) {
    // code here

    ArrayList<Integer> res = new ArrayList<>();

    for(int j=lo;j<=hi;j++) {
        if(isPrime(j) == true) res.add(j);
    }

    return res;
}
```

### 319. Bulb Switcher

Medium    1033    1751    Add to List    Share

There are  $n$  bulbs that are initially off. You first turn on all the bulbs, then you turn off every second bulb.

On the third round, you toggle every third bulb (turning on if it's off or turning off if it's on). For the  $i^{\text{th}}$  round, you toggle every  $i$  bulb. For the  $n^{\text{th}}$  round, you only toggle the last bulb.

Return the number of bulbs that are on after  $n$  rounds.

        n /= 10;  
    }  
}
```

} →  $O(\log_{10} N)$

## Count Digits

School Accuracy: **42.91%** Submissions: **9265** Points: **0**

Given a number **N**. Count the number of digits in **N** which evenly divides **N**.

### Example 1:

#### Input:

$N = 12$

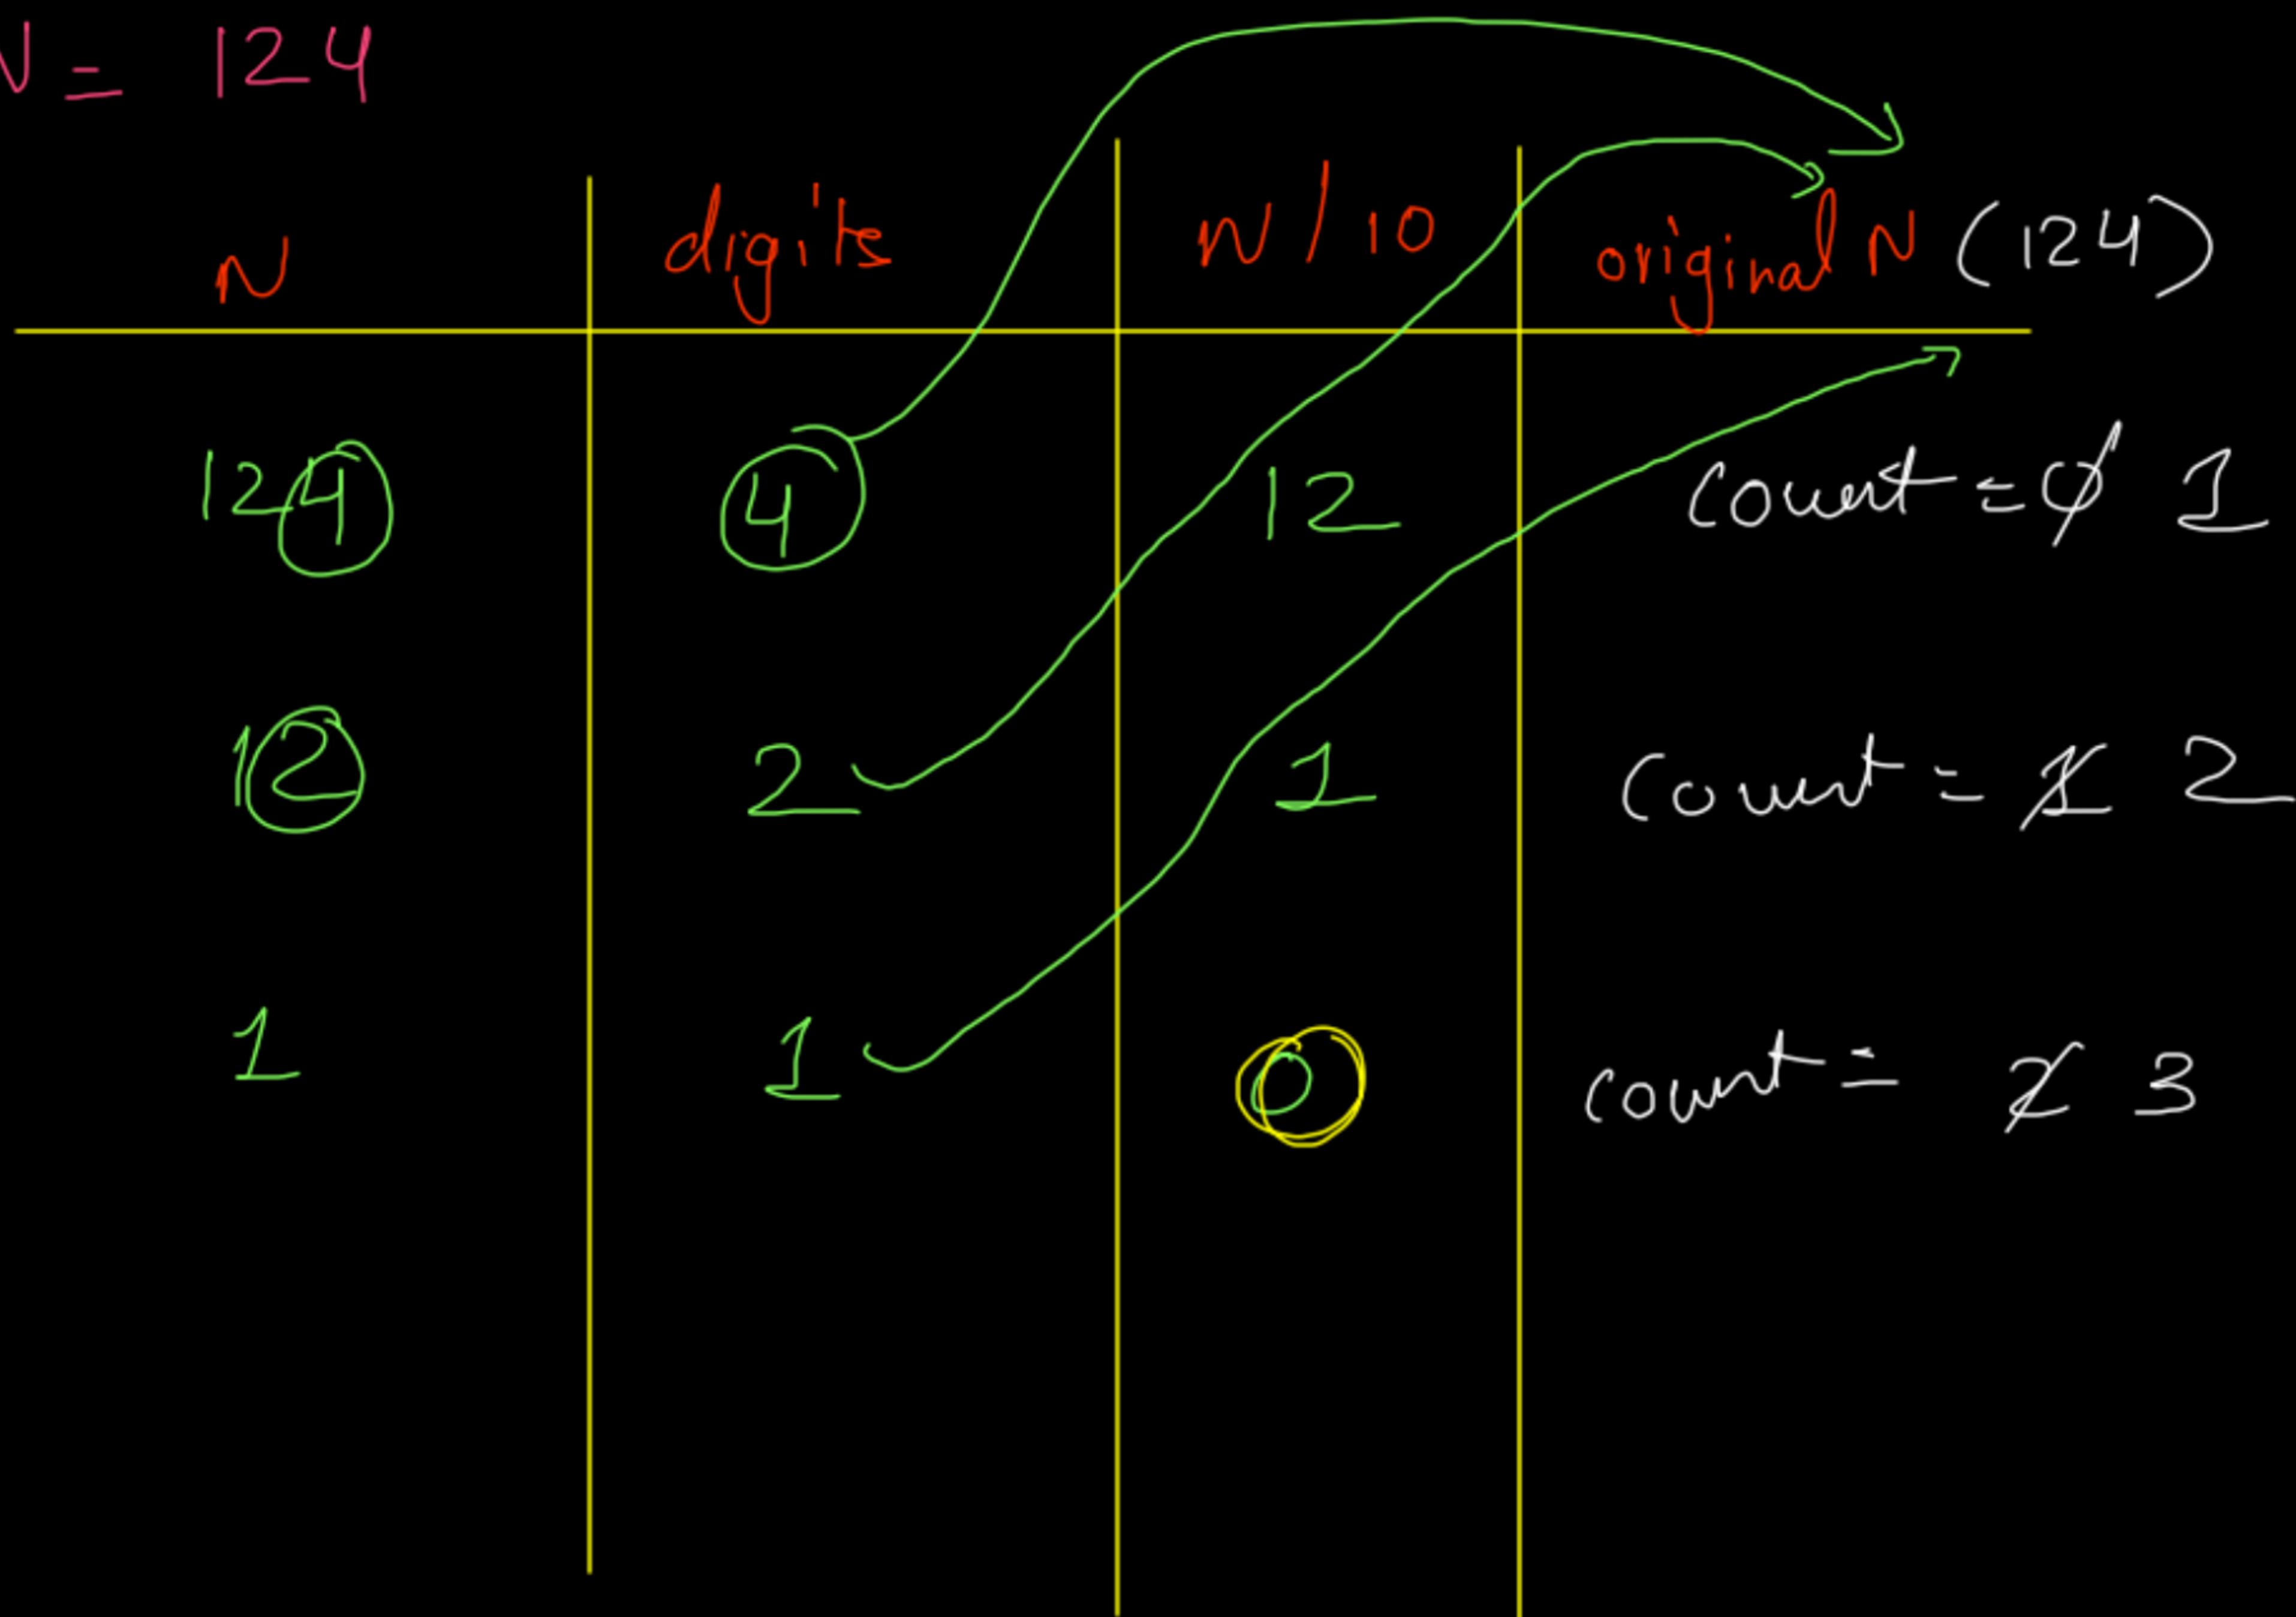

#### Output:

2

#### Explanation:

1, 2 both divide 12 evenly

$$N = 124$$

9 8 0 2 3 4

→ 9 8 2 3 4 % 0

∞

# Arithmetic Exception

↳ / by zero exception

```
class Solution{
    static int evenlyDivides(int N){
        // code here
        int originalN = N;
        int count = 0;

        while(N > 0) {
            int digit = N % 10;
            if(digit != 0 && originalN % digit == 0) {
                count++;
            }
            N /= 10;
        }

        return count;
    }
}
```

}

→  $O(\log_2 N)$

## Rotate A Number

Easy

◀ Prev

▶ Next

1. You are given two numbers  $n$  and  $k$ . You are required to rotate  $n$ ,  $k$  times to the right. If  $k$  is positive, rotate to the right i.e. remove rightmost digit and make it leftmost. Do the reverse for negative value of  $k$ . Also  $k$  can have an absolute value larger than number of digits in  $n$ .
2. Take as input  $n$  and  $k$ .
3. Print the rotated number.
4. Note - Assume that the number of rotations will not cause leading 0's in the result. e.g. such an input will not be given

$n = 12340056$

$k = 3$

$r = 05612340$

5 6 2 9 8 4 → N → nod = ⑥

→ k (No of rotations)

k / nod ?

## 1281. Subtract the Product and Sum of Digits of an Integer

Easy    1506    196    Add to List    Share

Given an integer number  $n$ , return the difference between the product of its digits and the sum of its digits.

**Example 1:**

Input:  $n = 234$

Output: 15

Explanation:

Product of digits =  $2 * 3 * 4 = 24$

Sum of digits =  $2 + 3 + 4 = 9$

Result =  $24 - 9 = 15$

$N_0 = 234$

| $N$ | digits | Sum<br>(0) | Product<br>(1) |
|-----|--------|------------|----------------|
| 234 | 4      | 4          | 4              |
| 23  | 3      | 7          | 12             |
| 2   | 2      | 9          | 24             |
| 0   |        |            |                |

$$\underline{24 - 9} = 15$$

```

class Solution {
    public int subtractProductAndSum(int n) {
        int sum = 0;
        int product = 1;

        while(n > 0) {
            int digit = n % 10;
            sum += digit;
            product *= digit;
            n /= 10;
        }

        return product - sum;
    }
}

```

### Armstrong Numbers

School Accuracy: 53.34% Submissions: 21079 Points: 0

For a given 3 digit number, find whether it is armstrong number or not. An **Armstrong number** of three digits is an integer such that the sum of the cubes of its digits is equal to the **number** itself. Return "Yes" if it is a armstrong number else return "No".

NOTE: 371 is an **Armstrong number** since  $3^3 + 7^3 + 1^3 = 371$

$$on = 1$$

$$n = 371 \quad \text{ans}$$

$$N \quad \text{digit} \quad \text{ans} \quad (\text{ans} = \frac{d \times d \times d}{d})$$

$$370 \quad 1 \quad 1$$

$$370 \quad 7 \quad 1 + (7 \times 7 \times 7) = 344$$

$$\begin{aligned} 371 & \quad 344 + (3 \times 3 \times 3) \\ &= 371 \end{aligned}$$

```

//User function Template for Java
class Solution {
    static String armstrongNumber(int n){
        // code here

        int originalN = n;
        int ans = 0;
        while(n > 0) {
            int d = n % 10;
            n/=10;
            ans += d*d*d;
        }

        if(ans == originalN) return "Yes";
        return "No";
    }
}

```

### 7. Reverse Integer

Medium 8234 10570 Add to List Share

Given a signed 32-bit integer  $x$ , return  $x$  with its digits reversed. If reversing  $x$  causes the value to go outside the signed 32-bit integer range  $[-2^{31}, 2^{31} - 1]$ , then return  $0$ .

Assume the environment does not allow you to store 64-bit integers (signed or unsigned).

#### Example 1:

Input:  $x = 123$   
Output: 321

#### Example 2:

Input:  $x = -123$   
Output: -321

1234

rev = 0

$$\text{rev} = (\text{rev} * 10) + \text{digit}$$

| No   | digit | $N/10$ | Rev  |
|------|-------|--------|------|
| 1234 | 4     | 123    | 4    |
| 123  | 3     | 12     | 43   |
| 12   | 2     | 1      | 432  |
| 1    | 1     | 6      | 4321 |

```

class Solution {
    public int reverse(int x) {
        int rev = 0;

        while(x != 0) {
            int digit = x % 10;

            rev = (rev * 10) + digit;
            x /= 10;
        }

        return rev;
    }
}

```

```

class Solution {
    public int reverse(int x) {
        int rev = 0;

        while(x != 0) {
            int digit = x % 10;

            if((rev > Integer.MAX_VALUE/10) || (rev < Integer.MIN_VALUE/10))
                return 0;

            rev = (rev * 10) + digit;
            x /= 10;
        }

        return rev;
    }
}

```

## 9. Palindrome Number

Easy    7012    2274    Add to List    Share

Given an integer `x`, return `true` if `x` is palindrome integer.

An integer is a **palindrome** when it reads the same backward as forward.

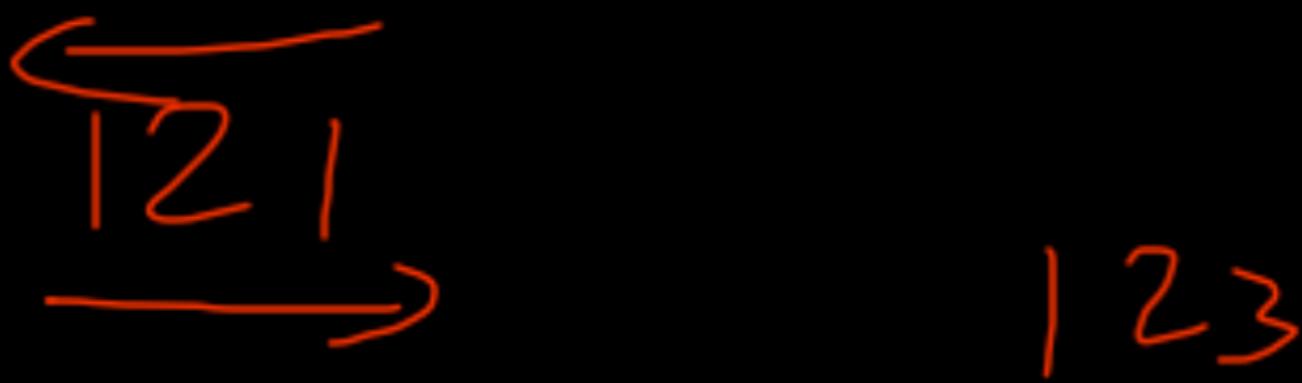

- For example, `121` is a palindrome while `123` is not.

### Example 1:

Input: `x = 121`

Output: `true`

Explanation: `121` reads as `121` from left to right and from right to left.

```
class Solution {  
  
    public int reverse(int x) {  
        int rev = 0;  
  
        while(x != 0) {  
            int digit = x % 10;  
            rev = (rev * 10) + digit;  
            x /= 10;  
        }  
  
        return rev;  
    }  
  
    public boolean isPalindrome(int x) {  
        if(x < 0) return false;  
        int reverse = reverse(x);  
        if(reverse == x) return true;  
        return false;  
    }  
}
```

# Inverse Of A Number

● Easy

◀ Prev

▶ Next

1. You are given a number following certain constraints.
2. The key constraint is if the number is 5 digits long, it'll contain all the digits from 1 to 5 without missing any and without repeating any. e.g. 23415 is a 5 digit long number containing all digits from 1 to 5 without missing and repeating any digit from 1 to 5. Take a look at few other valid numbers - 624135, 81456273 etc. Here are a few invalid numbers - 139, 7421357 etc.
3. The inverse of a number is defined as the number created by interchanging the face value and index of digits of number. e.g. for 426135 (reading from right to left, 5 is in place 1, 3 is in place 2, 1 is in place 3, 6 is in place 4, 2 is in place 5 and 4 is in place 6), the inverse will be 416253 (reading from right to left, 3 is in place 1, 5 is in place 2, 2 is in place 3, 6 is in place 4, 1 is in place 5 and 4 is in place 6) More examples - inverse of 2134 is 1243 and inverse of 24153 is 24153
4. Take as input number "n", assume that the number will follow constraints.
5. Print it's inverse.

## Input Format

"n" where n is any integer, following constraints defined above.

$N \rightarrow 1$  to  $N$  digits

8 7 6 5 4 3 2 1  
 2 8 3 4 6 7 5 ① → place value  
 ↓

Given a number N. The task is to print a series of asterisk(\*) from 1 till N terms with increasing order and difference being 1.

### Example 1:

#### Input:

N = 3

#### Output:

\* \* \* \*\*\*

#### Explanation:

First, print 1 asterisk then space after  
that print 2 asterisk and space after that  
print 3 asterisk now stop as N is 3.

for  $N=3$

A horizontal row of eight empty black rectangular boxes, each containing a yellow five-pointed star icon. These boxes are intended for users to write their reviews or ratings.

# Task → print \*

**Input Format**

A number n

**Output Format**

The image shows a 5x5 grid of asterisks (\*). The asterisks are arranged to form a right-angled triangle pointing towards the top-right corner. The first five columns from the left contain all five asterisks, while the subsequent columns contain fewer asterisks: column 6 has 4, column 7 has 3, column 8 has 2, and column 9 has 1. This creates a triangular shape where each row i contains  $i$  asterisks.

Output:

```
*****
 * *
  * *
   * *
    * 
```

### Problem Statement

[Suggest Edit](#)

You are given an integer 'N'. Your task is to print the following pattern for the 'N' number of rows.

For Example:

Pattern for 'N' = 5:

```
* * *
* *** 
***** 
* *** 
* * *
```

|   | 1 | 2 | 3 | 4 | 5 |
|---|---|---|---|---|---|
| 1 |   |   | * |   |   |
| 2 |   | * | * | * |   |
| 3 | * | * | * | * | * |
| 4 | * | * | * |   |   |
| 5 |   | * |   |   |   |

$\rightarrow i=1$   
 $\rightarrow i=2$   
 $\rightarrow i=3$

# Upper half

Let  $k = n/2 + 1$ ;  $\rightarrow 3$

Spaces  $\rightarrow k - i$

Stars  $\rightarrow 2^i - 1$

$\begin{array}{ccccccc} & & & & * & & \\ & & & & * & * & * \\ & & & & * & * & * \\ & & & & * & * & * \\ & & & & * & * & * \\ & & & & * & * & * \\ & & & & * & & \\ \end{array}$

# Second Half

Stars  $\rightarrow$  start from  $N-2$  &  
keep decrementing by 2

Spaces  $= i$

```
int k = n/2 + 1;

//first half
for(int i=1;i<=k;i++) {
    //spaces
    for(int sp=1;sp<=k-i;sp++) {
        System.out.print(" ");
    }

    //stars
    for(int j=1;j<=2*i-1;j++) {
        System.out.print("*");
    }

    System.out.println();
}
```

```
//second half
int stars = n-2;
for(int i=1;i<=n-k;i++) {
    //spaces
    for(int sp=1;sp<=i;sp++) {
        System.out.print(" ");
    }

    //stars
    for(int j=1;j<=stars;j++) {
        System.out.print("*");
    }

    System.out.println();
    stars -= 2;
}
```

### Problem Statement

Ninja wants to build a number pattern for the given integer.

For example, If the given integer 'N' is 4

Pattern:

1  
23  
345  
4567

$$N=5$$

|   | 1 | 2 | 3 | 4 | 5 |        |
|---|---|---|---|---|---|--------|
| 1 | 1 |   |   |   |   | 1^{st} |
| 2 | 2 | 3 |   |   |   | 2^{nd} |
| 3 | 3 | 4 | 5 |   |   | 3^{rd} |
| 4 | 4 | 5 | 6 | 7 |   | 4^{th} |
| 5 | 5 | 6 | 7 | 8 | 9 | 5^{th} |

```
1 import java.util.*;
2 public class Main {
3     public static void main(String[] args) {
4         Scanner scn = new Scanner(System.in);
5         int n = scn.nextInt();
6
7         for(int i=1;i<=n;i++) {
8             //numbers
9             int num = i;
10            for(int j=1;j<=i;j++) {
11                System.out.print(num + "\t");
12                num++;
13            }
14
15            //leave line
16            System.out.println();
17        }
18    }
19 }
20 }
```

---

**Problem Statement**

Ninja wanted to go to a party along with his friends. However, his mom wanted him to go only if he completes a task assigned by her.

She gave Ninja a value and asked him to print an X-shaped pattern.

Example : Pattern for N = 3 (No. of rows = 5, No. of columns = 5) :

```
1   1
 2 2
 3
 2 2
1   1
```

|   | 1 | 2 | 3 | 4 | 5 |
|---|---|---|---|---|---|
| 1 | 1 |   |   |   | 1 |
| 2 |   | 2 |   | 2 |   |
| 3 |   |   | 3 |   |   |
| 4 |   | 2 |   | 2 |   |
| 5 | 1 | . |   |   | 1 |

3

$$(5 - 4 + 1) = 2$$

$$(5 - 5 + 1) = 1$$

$i$   $j$   $N$

\* \* \* \*

\* \* \* \*

\* \* \*

\* \*

$\rightarrow$   $y$

$\rightarrow$   $s$

$(N - i + 1)$

```
public static void ninjaPattern(int N) {  
    // Write your code here.  
    // N= 3  
    // n = 2*N-1  
  
    int n = 2*N-1;  
  
    for(int i=1;i<=n;i++) {  
        for(int j=1;j<=n;j++) {  
            if(i == j || i+j == n+1) {  
                if(i <= n/2 + 1) System.out.print(i);  
                else System.out.print(n-i+1);  
            } else {  
                System.out.print(" ");  
            }  
        }  
        System.out.println();  
    }  
}
```

### Problem Statement

[Suggest Edit](#)

Ninja's younger sister got a project to print the pattern for the given number of rows, say 'N'. She finds it difficult to write such a pattern for every 'N'.

Ninja decided to help his sister and decided to write a code for this but wasn't able to write the code for the same. Ninja wants help to write a code and asks you for help. Help Ninja.

#### Example:

Pattern for N = 2

```
0  
101  
21012
```

for  $N=2$

|   | 1 | 2 | 3 | 4 | 5 |
|---|---|---|---|---|---|
| 0 |   |   | 0 |   |   |
| 1 |   | 1 | 0 | 1 |   |
| 2 | 2 | 1 | 0 | 1 | 2 |

$[1 \text{ to } N] \rightarrow N$

1 2 3 4 ... N

$[1 \text{ to } 5]$

1 2 3 4 5

{0 to N}  $\rightarrow N+1$  times

$[0 \text{ to } N-1] \rightarrow N$

# Spaces  $\rightarrow N-i$

$[0-4]$

#  $2^{i+1}$  Numbers  $\rightarrow$  print

0, 1, 2, 3, 4

```

public class Solution {
    public static void NumberPattern(int n) {
        // Write your code here

        for(int i=0;i<=n;i++) {

            int num = i;

            for(int sp=1;sp<=n-i;sp++) {
                System.out.print(" ");
            }

            for(int j=1;j<=2*i+1;j++) {
                System.out.print(num);
                if(j < (2*i + 1)/2 + 1) {
                    num--;
                } else {
                    num++;
                }
            }

            System.out.println();
        }
    }
}

```

$j \leq 5$

for  $N=2$

|   | 2 | 3 | 4 | 5 |
|---|---|---|---|---|
| 0 |   | 0 |   |   |
| 1 | 1 | 0 | 1 |   |
| 2 | 2 | 1 | 0 | 1 |

$\text{num} = 2$

$j = 1, 2, 3, 4$

$$(2^i + 1)/2 + 1$$

$$= (2 * 2 + 1)/2 + 1 \quad 2 \ 1 \ 0 \ 1 \ 2$$
